

Ideation Phase

Brainstorm & Idea Prioritization

Date	20 February 2026
Team ID	LTVIP2026TMIDS24635
Project Name	Flight finder-Navigating your air travel options
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization:

The ideation phase focuses on identifying real-world problems related to air travel and generating innovative solutions through collaborative brainstorming. This phase encourages open discussion, creative thinking, and evaluation of ideas to select the most feasible and impactful solution. The goal is to prioritize ideas that enhance user experience, reduce effort, and improve decision-making in flight booking.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

During the team discussion, members shared personal experiences and challenges faced while booking flights online. Common issues identified included high price fluctuations, lack of transparency, time-consuming comparisons across platforms, and difficulty in choosing the best flight option.

Selected Problem Statement:

“Users find it difficult and time-consuming to search, compare, and book flights at the best price due to scattered information, frequent price changes, and lack of intelligent recommendations.”

This problem was selected because it affects a large number of users and has strong potential for a technology-driven solution.

Step-2: Brainstorm, Idea Listing and Grouping

After defining the problem, multiple solution ideas were generated and grouped based on functionality:

Idea List:

- Flight search using source, destination, and travel date
- Fare comparison across multiple airlines
- Smart filters (price, duration, stops, airline)
- Machine learning-based price prediction
- Personalized flight recommendations
- Email notifications for booking confirmation
- Admin panel for managing flight data
- Secure login and user authentication
- Booking history and ticket management
- Future chatbot assistance for travel queries

Grouping of Ideas:

- **Core Features:** Flight search, filters, booking system
- **Intelligent Features:** ML-based recommendations, price prediction
- **User Management:** Login, registration, booking history
- **Admin Features:** Flight data upload, approval management
- **Enhancement Features:** Notifications, chatbot (future scope)

Step-3: Idea Prioritization

The ideas were prioritized based on **impact, feasibility, and user value**.

High Priority:

- Flight search and filtering
- Secure user authentication
- Flight booking system
- ML-based flight recommendations

Medium Priority:

- Admin panel for flight management
- Email confirmation system
- Booking history tracking

Low Priority (Future Enhancements):

- Real-time flight updates
- Travel assistant chatbot
- Dynamic pricing alerts

Based on this prioritization, the team decided to focus on developing a **web-based flight search and booking application enhanced with machine learning recommendations**, named **FlightFinder**.

Outcome of Ideation Phase

The ideation phase successfully resulted in:

- A clearly defined problem statement
- A structured list of possible solutions
- Selection of feasible and high-impact features
- A well-prioritized roadmap for development

This phase laid a strong foundation for the subsequent requirement analysis and system design stages.
